

Comments from: Ron Wallace  
Subject: Assignment of 'TV Whitespaces' TV Broadcast Spectrum for  
unlicensed use in the Wireless Internet Service Industry

To All concerned:

I fully support the assignment of unused TV Broadcast Frequencies to the unlicensed Wireless Internet Service Providers. I operate a Wireless Internet Service in Southern Michigan. My service area is characterized by rolling hills, covered with 60-100' hardwood tree forest plots of varying sizes. This terrain and the accompanying trees lining rural roads and forest plots block Radio Frequencies above 900 MHz quite effectively.

Additionally, I fully support the [WISPA "White Spaces" Comments](#) filed 2/20/2007, by Mr. Marlon Shafer.

The use of frequencies below 700 MHz will allow service providers nation wide to reach all users within their service areas.

Frequency assignment and coordination among Wireless Providers and TV Broadcasters shall mitigate RF interference with those Broadcasters and their customers. Arguments to the contrary are non-productive.

We, the Wireless Internet Service Providers, and our organization WISPA, have worked closely with the FCC to clear the way for this important frequency assignment.

Thank you for this opportunity to comment.

We look forward to using the TV Whitespaces to provide our customers with excellent high-speed Internet service, as soon as you assign those frequencies for our use.
